

DriCAT[®] 2700F

A high activity Manganese based complexed carboxylate to replace cobalt carboxylates in all solvent and water based systems.

As a cobalt alternative DriCAT[®] 2700F works in combination with other Dura metal carboxylates for the most effective drying / curing.

DriCAT[®] 2700F shows hardness development comparable to that of cobalt driers; a major point of failure of earlier and current alternative products developed as cobalt free systems.

DriCAT[®] 2700F has minimal effect on the long term discoloration of the finished article, and can be an improvement on current cobalt based systems.

DriCAT[®] 2700F does not require the addition of further non-metallic additives to boost performance.
